Database Design

Ajeditsdb

Ajeditsdb Freelancer Online Business

Introduction: For my final project, I want to create a database representing the clients I did video editing for on fiverr as a freelancing online business:

Ajedits26 is a freelancing video editing online business hosted on fiverr, and it offers viral short-form and long-form edits with clean animations and motion graphics. The software I use to edit every project is called Davinci Resolve. A client clicks on my gig page and views the description, chooses a pricing package ranging from Basic, Standard, Premium, they can look at reviews from previous clients, and can browse sample projects. Clients will send a message to the seller to discuss requirements or ask about my skills, click order now, provide detailed project instructions/deadlines, and remain in real-time constant contact with sellers to track work progress.

Create DB for Final Project: ajeditsdb

```
postgres=# CREATE DATABASE ajeditsdb;
CREATE DATABASE
postgres=# \c ajeditsdb
You are now connected to database "ajeditsdb" as user "postgres".
ajeditsdb=# |
```
